

Release 1.0 Acceptance Document  
Team TutorTube, March 16, 2017

User Stories that are functioning:

- As a user I want to login and create an account so that I can login
- As a developer I want to make a user database to keep track of users
- As a developer I want to create a login page and controller so users can login and submit a form to create account
- As a student I want to add myself to a class so that I can monitor class activity
- As an instructor I want to create a class so that I can monitor class activity
- As a developer I want to make a class database so that I can link users to classes and use the database in when creating the HTML page
- As a user I want to upload video or text responses so that I can help other students in my class understand the material
- As a developer I want to be able to implement a chat room so that small group discussions can exist
- As a developer I want to be able to style my website so that it is understandable and easy to use

List of known bugs:

- tags in the left sidebar of /index do not redirect to another page
- Calendar in left sidebar of /index does not function
- Return key does not do a line break in the text box in submit post/comment. It submits it directly.
- Create post, edit post, create comment, and edit comment do not redirect back to the classes or post page after submitting.
- Add class is case sensitive (if the syntax does not match that of an existing class, it will add you to a new class with the different syntax you provided).
- Search engine does not work
- User cannot delete classes, but can delete posts
- Video audio only works in certain browsers

- In create post and create comment, the text extends outside of the box on one line instead of adjusting to the box with new lines.
- Lines that separate posts are not resizable to the browser
- Comments are posted by date created instead of from first to most recent comment.
- If you try to add an existing class that you are already enrolled in, it will not skip it
